                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                10.5 Kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gild;4732114|gb|AF129072.1), a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically competent E. coll XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                 (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide Kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GSS 14-NOV-2000

This GSS is part of a random genomic sequencing program of thirteen
yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces
exiguus, Saccharomyces servazzii, Zygosaccharomyces rouxii,
saccharomyces Kluyveri, Kluyveromyces remracherans, Kluyveromyces
saccharomyces kluyveri, Kluyveromyces marxianus var. marxianus, Pichia
angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila,
Candida troploalis and Yarrowia lipolytica. Genomic inserts of 3 to
5 kb were prepared and both extramities were sequenced. See
keywords for description of this sequence and for the sequence of
the other extremity of this insert.
Gaillardin, C. and Casaregola, S. Genomic exploration of the hemiascomycetous yeasts: 9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /organism="Saccharomyces kluyveri"

                                                                                                                                                                                                                                                                                                                                                                                                                 (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 yinch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymorleotide kinase. Adaptor oligonicleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose get of pw72 (gilfy732114)gblAF129072.1), a copy number of pw72 (gilfy732114)gblAF129072.1), a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into adaptored for any sheared adaptored mouse DNA was annealed to adaptored for any configuration into adaptored for any configuration into a data selected for ampleillin resistance. "tratagone) cells and selected for amplcillin resistance."

Laboratory Mouse, manaley and the control in the control laboratory mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel clectrophoresis. Vector DNA was prepared from a derivative of pubassis. Vector DNA was prepared from a derivative inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to chemically-competent E. coli XLIO-Gold (Stratagene) cells and selected for ampicillin resistance."

VERSION

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 Dolymucleotide kinase. Adaptor ollgonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel clectrophoresis. Vector DNA was prepared from a derivative of pwD42 (gil47321141gb) AR129072.1), a copy-number with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to chemically incompanies.
                                                                                                                                                                                                                                                                                                        Unpublished (2000)

Determination of this BAC-end sequence was carried out as part of a collaboration with the Barkeley Drosophia Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophia melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophia melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial Ecoral digestion of Drosophila DNA provided by the BDGP from the lisogenic strain y2; on by sp, the same strain used for the BDGP's and bow to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://wacpac.med.buffalo.edu/drosophila_bac.htm.

Determination of this BAG-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk - This Drosophila melanogaster BAC |
Inbrary (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
                                                                                                                                                                                                                              ö

This GSS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces servazzii, Zygosaccharomyces convaii,

Saccharomyces kluyveri, Kluyveromyces thermotolerans, Kluyveromyces thermotolerans, Kluyveromyces and saccharomyces hansenii var. hansenii, Pithia sorbitophila,

Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of
CNSO7A2Y 1063 bp DNA linear GSS 08-JUL-2001 T3 end of clone BCOAA001B01 of library BCOAA from strain CBS 767 of Debaryomyces hansenii, genomic survey sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

~

The isolation and purification of the high molecular weight protein enables the identification of the major protective epitopes of the protein by conventional epitope mapping. These epitopes can then be synthesised using standard techniques and incorporated into fully synthetic or recombinant vaccines. Claim 4; Figure 4; 100pp; English.

```
This protein comprises the high molecular weight surface protein

HWW2 (123 MDa) of non-typeable Haemophilus influenzae strain 12 that

has the immunological ability to protect against disease caused by a

non-typeable Haemophilus strain and is characterised by at least
one surface-exposed B-cell epitope that is recognised by monoclonal

antibody AD6. The HWM2 amino acid sequence was deduced from the

sistuncated, starting at residue 442 of the full-length gene

hmw2 gene sequence (see AAT90995 and AAT90997). The expressed protein

sistuncated, starting at residue 442 of the full-length gene

product. HWW1 (see AAW30291) HWW3 (see AAW30291) and HWW4 (see

C product. HWW1 (see AAW30293), HWW3 (see AAW30292) and Synthetic

peptide of 6-150 amino acids corresponding to at least protective

epitope of HWW2 are also claimed. HWW proteins, conjugates and

c peptides can be used in vaccines, as immunogens for preparation of

antibodies and as antigens for detection of these antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       High molecular weight proteins of non-typeable Haemophilus influenzae - useful for vaccine production

proteins of Haemophilus which are used as a vaccine to provide protection against Haemophilus induced diseases in humans Example 16; Fig 29A-N; 307pp; English.

Nucleic acid molecule for producing recombinant high molecular weight

influenzae high molecular weight (HMW) proteins in Escherichia coli. The expression construct used to effect recombinant expression comprises a promoter functional in E. coll (e.g., the T7 promoter) operably linked to a modified hwwABC operon from a non-typeable (non-encapsulated) Hillumillumizae (NTHI). Most HMW-expressing NTHI strains contain two hww gene clusters termed hmwlABC and hmwABAC. Each hmwABC operon comprises hmwA, The invention relates to the recombinant production of Haemophilus

proteins which can be used as vaccines to mediate a humoral or cell-mediated immune response to provide protection against diseases in humans caused by H. influenzae (e.g., othits media, epidottitis, proneumonia and tracheobronchitis). The HWM proteins are also useful as antigens in immunoassays for detecting antibodies against Haemophilus, HWW proteins and/or HWW peptides. The nucleotide sequences encoding the HWM proteins can be used to isolate and clone hww genes from other non-typeable strains of Haemophilus via hybridisation reactions. The present sequence represents an HWMA protein from a non-typeable strain of hmwB and hmwC genes. The hmwA genes encode the structural HWWA proteins and the hmwB and hmwC genes encode accessory proteins which are responsible for post-translational processing and secretion of the HWWA proteins. The modified hmwABC operon used in the expression construct of the invention contains an A gene modified such that it encodes only the mature HWMA. The invention also discloses hmwA genes (AAA5175-A52198) and HWMA proteins (AAB01024-B01849) from the non-typeable H. influenzae strains Joyc, KI, K21, LCDC2, PMHJ, 15 and 12. The nucleic acids and vectors are used for the production of recombinant H. influenzae HWM H. influenzae. 9999999999999999999999

The encoded protein can also be used as a carrier for protective Hib polysaccharide (in a conjugate vaccin against meningitis) or for other antigens, haptens, etc.

                                                                                                                                                                                                                                                The isolation and purification of the high molecular weight protein enables the identification of the major protective epitopes of the protein by conventional epitope mapping. These epitopes can then be synthesised using standard techniques and incorporated into fully synthetic or recombinant vaccines. This sequence is claimed to be the same as that given in AAR41724 (High molecular weight protein 2) although it does differ slightly.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This protein comprises the high molecular weight surface protein HWW4 (123 kDa) of non-typeable Haemophilus influenzae strain 5 that has the immunological ability to protect against disease caused by an on-typeable Haemophilus strain and is characterised by at least one surface.exposed B-cell epitope that is recognised by at least one surface.exposed B-cell epitope that is recognised by monoclonal antibody ADG. The HWM4 amino acid sequence was deduced from an isolated hmw4 gene (see AAM79093). HWM1 (see AAM30293), HWM2 (see AAM30294) and HWM3 (see AAM30291) have also been identified. A conjugate comprising HWM4 linked to an antigen, hapten or polysaccharide, and a synthetic peptide of 6-150 amino acids corresponding to at least protective epitope of HWM4 are also claimed. HWM proteins, conjugates and peptides can be used in vaccines, as immunogens for preparation of antibodies and as antigens for detection of these antibodies.
Non-typeable Haemophilus; high molecular weight surface protein; HMW4; immunogen; vaccine; otitis media.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ouery Match

(CONN-) CONNAUGHT LAB LTD. 

Loosmore SM, Yang Y, Klein MH;

WPI; 2000-303789/26. N-PSDB; AAA52198 Nucleic acid molecule for producing recombinant high molecular weight proteins of Haemophilus which are used as a vaccine to provide protection against Haemophilus induced diseases in humans.

Claim 8; Fig 29E-N; 307pp; English.

The invention relates to the recombinant production of Haemophilus confluenzae high molecular weight (HWW) proteins in Escherichia coli. The expression construct used to effect recombinant expression comprises a promoter functional in E. coli (e.g., the T7 promoter) operably linked to a modified hmwABC operon from a non-typeable (non-encapsulated) H. Clifluenzae (NTHi). Most HWW-expressing NTHI strains contain two hmw gene clusters termed hmwJABC and hmwABC. Each hmwABC operon comprises hmwA, and hmwC genes. The hmwA genes encode accessory proteins which are responsible for post-translational processing and secretion of the HWWA creams encode the structural HWWA proteins creaming and secretion of the HWWA contains and A gene modified such that it encodes only the mature HWWA. The invention also discloses hmwA encodes only the mature HWWA. The invention also discloses hmwA encodes only the capture HWWA. The invention also discloses hmwA encodes only the strains Joyc, KI, KI, LOCZ, PWHI, S and I2. The nucleic acids and vectors are used for the production of recombinant H. influenzae HWW correins which can be used as vaccines to mediate a humoral or cell-mediated immune response to provide protection against diseases in

```
ö
humans caused by H. influenzae (e.g., otitis media, epiglottitis, pneumonia and tracheobronchitis). The HWW proteins are also useful as antigens in immunoassays for detecting antibodies against Haemophilus, HWW proteins and/or HWW peptides. The nucleotide sequences encoding the HWW proteins can be used to isolate and clone hmw genes from other non-typeable strains of Haemophilus via hybridisation reactions. The present sequence represents a mature HWWA protein from a non-typeable strain of H. influenzae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1283 SINAANVTLNTTCTLTVAGSDIKATSGTLVINAKDAKLNGDASGDSTEVNAVNASGSGS 1342

These epitopes can then be synthesised using standard techniques and incorporated into fully synthetic or recombinant vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                             The isolation and purification of the high molecular weight protein enables the identification of the major protective epitopes of the protein by conventional epitope mapping. These epitopes can then be synthesised using standard techniques and incorporated into fully synthetic or recombinant vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

HMW1 (125 kDa) of non-typeable Haemophilus influenzae strain 12 that has the immunological ability to protect against disease caused by a non-typeable Haemophilus strain and is characterised by at least on on-typeable Haemophilus strain and is characterised by at least cone sufface-exposed B-cell epitope that is recognised by monoclonal attibuted AD6. The HMW1 amino acid sequence was deduced from the ist truncated, starting at residue 442 of the full-length gene is truncated, starting at residue 442 of the full-length gene product. HMW2 (see AAM30294), HWW3 (see AAM30294), HWW3 (see AAM30294), HWW3 (see AAM30294), HWW3 (see AAM30295) and my30292) have also been identified. A conjugate comprising HWM1 linked to an antigen, hapten or polysaccharide, and a synthetic peptide of 6-150 amino acids corresponding to at least protective peptides can be used in vaccines, as immunogens for preparation of antibodies and as antigens for detection of these antibodies. 8\$888888888888888

                                                                                                                                                                                                   The HWM1 protein encoded by this sequence is useful in a vaccine to protect against disease caused by non-typeable Haemophilus which are not controlled by H. influenzae type b (Hib) vaccines. The encoded protein can also be used as a carrier for protective Hib polysaccharide (in a conjugate vaccin against meningitis) or for other antigens, haptens, etc.

producing recombinant high molecular weight proteins of Haemophilus which are used as a vaccine to provide protection against Haemophilus induced diseases in humans -Nucleic acid molecule for

Example 16; Fig 28A-Q; 307pp; English.

The invention relates to the recombinant production of Haemophilus influenzae high molecular weight (HMW) proteins in Escherichia coli. The expression construct used to effect recombinant expression comprises a promoter functional in E. coli (e.g., the T7 promoter) operably linked to a modified hmwABC operon from a non-typeable (non-encapsulated) H. Colifluenzae (NTHI). Most HWW-expressing NTHI strains contain two hmw gene clusters termed hmwlaBC and hmw2ABC. Each hmwABC operon comprises hmwA, hmwB and hmwC genes encode accessory proteins which are cresponsible for post-translational processing and secretion of the HWMA proteins. The modified hmwABC operon used in the expression construct of proteins. The modified hmwABC operon used in the expression construct of proteins. The modified hmwABC operon used in the expression construct of mature HWMA. The invention also discloses hmwA genes (AAA72175-A52198) and HWMA proteins and slo discloses hmwA genes (AAA72175-552198) and HWMA proteins discloses hmwA genes (AAA72175-552198) and HWMA proteins which can be used as vaccines to mediate a humoral or proteins which can be used as vaccines to mediate a humoral or cell. mediated immune response to provide protection against Haemophilus, the munical and tracheobronchitis). The HWM proteins are also used to isolate and clone hmw genes from other constructs and present sand presents and human proteins and prot

                                                                  The isolation and purification of the high molecular weight protein enables the identification of the major protective epitopes of the protein by conventional epitope mapping. These epitopes can then be synthesised using standard techniques and incorporated into fully synthetic or recombinant vaccines. This sequence is claimed to be at the same as that given in AAR41723 (High molecular weight protein although it does differ slightly. (Repeated regions which are possibly incorrect and occur in the corresponding nucleotide coding sequence contribute to these differences).

This protein comprises the high molecular weight surface protein than (125 kDa) of non-typeable Haemophilus influenzes strain 5 that has the immunological ability to protect against disease caused by a non-typeable Haemophilus strain and is characterised by at least one surface-exposed B-cell epitope that is recognised by monoclonal solated humwa apene (see AAT90992). HMM1 (see AAW30291), HMM2 (see AAW30294) and HMW4 (see AAW30292), have also been identified. A AAW30294) and HWW4 (see AAW30292) have also been identified. A conjugate comprising HWW3 linked to an antigen, hapten or corresponding to at least protective epitope of fiNW3 are also claimed. HWW proteins, conjugates and peptides can be used in vaccines, as immunogens for preparation of antibodies and as mingens for detection of these antibodies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The isolation and purification of the high molecular weight protein enables the identification of the major protective epitopes of the protein by conventional epitope mapping. These epitopes can then be synthesised using standard techniques and incorporated into fully synthetic or recombinant vaccines.
